TinyOPDS is an open source application that is based on the TinyODPS server described in the TOS document. TinyOPDS runs without the need of a database (MySQL, PostgreSQL) or an access to a web server. It does not require ODPS or XOPSD configuration. It can be used in connection with a http web server but, it is also usable with the command line. TinyOPDS Configuration and administration: TinyOPDS uses the ODPS and TinyODPS (TOS) format. TinyOPDS can be installed on any Linux distribution (Ubuntu, Debian, Fedora, Redhat, CentOS, Gentoo, ...). It can be installed on Debian and Ubuntu systems without any dependencies. TinyOPDS can be installed via the apt-get tool (Debian) or yum tool (RHEL/Fedora/CentOS). You can start TinyOPDS from your graphical interface using the following command: `sudo service tinyopds start` Then, you can access TinyOPDS administration via a web browser on port 9999 (SSH tunnel is used by default). It is very important to change the port to avoid access restrictions to this server. At the moment, TinyOPDS runs on port 9999 only. For the given configuration, it is possible to access the following services: User accounts management Group accounts management User passwords Grant/revoke user access to services and applications Configuration/log file management Generate/edit ODPS publications Migrations of existing publications The TinyOPDS Web server is started automatically after TinyOPDS installation. You can start it manually if you need, via the following command: `sudo service tinyopds start` Then, you can access TinyOPDS administration via a web browser on port 9999 (SSH tunnel is used by default). What's New In?

TinyOPDS is a handy and reliable application designed to create and configure ODPS servers. It does not require a web server or a database engine. Publishers, websites, blogs and other online service provider use ODPS format (Open Publication Distribution System) to publish and distribute their website content. ODPS is an XML-based open standard for publishing and distributing electronic books and other information over the Internet. ODPS is short for Open Publication Distribution System and refers to a syndication format that deals with electronic publications (books). Syndication provides a framework for distributing content among the various media used to communicate it, making it possible for that content to be used in new and different ways. ODPS is a technical specification of standards-based technology for publishing and distributing electronic publications. ODPS is compatible with the other relevant standards in this area, such as RSS (for syndication of web content) and Atom (for the standard of the publication of syndicated content). For a publisher to use this technology, they first need to buy an ODPS server that will allow them to publish their content online. Their content will be organized in a way that is made available to users by the ODPS server. The user will use a suitable browser, and the data is delivered via the Internet. Thanks to ODPS, publishers can easily include links to other pages, images, videos, audio files, blog posts, etc. on their website. TinyODPS is a small but very handy application designed to create and configure ODPS

servers. It does not require a web server or a database engine. It is a tiny version of ODPS Creator Pro, a larger and more powerful application. What's New in TinyODPS: TinyODPS Version 2.3.2: ODPS Creator Pro Version 2.3.1 ODPS Creator Pro is a powerful and reliable application designed to create and configure ODPS servers. It requires a web server or a database engine. ODPS Creator Pro Features: 1. Works with both ADP and MySQL databases 2. Imports books from a local library or a file saved in a computer 3. Manages content and publication settings 4. Generates XML 5. Shows the status of a project 6. Generates menu bar and toolbar icons 7. Allows navigation from any page 8.
