Distribution, exposure, and characterization of zinc in rhizosphere and bulk soil of maize grown on heavy-metal-contaminated soil. An integrated approach was used to study the effects of soil contamination on the accumulation of zinc (Zn) by maize, and to determine the physiological activities of rhizosphere and bulk soil microbiota that might contribute to Zn translocation in maize. Amended soils were prepared with Cu (0.5%), Zn (0.5 and 1.0%), and Cd (10 mg kg(-1)). All soils were spiked with Zn, Cd, and Cu. The results showed that the plant biomass and the Cd and Cu concentrations in maize shoots were higher in plants grown in soil containing 1.0 mg Zn kg(-1) soil than in plants grown in the other two soil types, and Zn accumulation in shoots was most increased in plants grown in soil amended with Cu and Cd. Rhizosphere and bulk soil microbial biomass, activities, and concentrations of Zn were also determined. The results showed that the Zn bioavailability was higher in rhizosphere soil than in bulk soil, and the concentrations of most soil parameters measured were higher in the rhizosphere than in the bulk soil. Zn increased the colonization rate and activities of soil microorganisms in both the rhizosphere and bulk soil. Higher colonization was observed in the rhizosphere soil. These results suggest that zinc stress should be considered during the management of contaminated soils. The effect of low-dose olanzapine in treatment-resistant schizophrenia. Treatment-resistant schizophrenia poses a major challenge to clinicians and has been associated with greater physical and mental morbidity. Atypical antipsychotics have been evaluated in this subgroup and found to be effective. The authors hypothesized that low-dose olanzapine would be an effective and well-tolerated treatment option in this difficult to treat patient group. We examined the treatment response of patients with treatment-resistant schizophrenia to low-dose olanzapine. Forty-five patients with treatment-resistant schizophrenia were enrolled in a randomized, double-blind, placebo-controlled clinical trial of low-dose olanzapine (5 mg) for 6 weeks. Clinical assessments were conducted at baseline and weeks 2, 4, and 6. Thirty-eight patients were included in the analysis of which 14 were randomly assigned to olanzapine and 24 to placebo. Patients in the olanzapine group experienced significant improvement in psychopathology at week 2 and 4, whereas patients in the placebo group did not improve until week 6. A repeat-measures multivariate analysis of covariance revealed that olanzapine was significantly different from placebo, and time was significantly different from baseline, demonstrating the treatment response to low-dose olanzapine over time. Mean changes on PANSS-T scores were significantly greater in patients who received olanzapine for a 6-week duration. Olanzapine was well tolerated and patients who received low-dose olanzapine showed improvement in their symptoms of schizophrenia with no reports of treatment-related adverse events. Compared with patients who received placebo, patients receiving olanzapine had significantly lower PANSS-T and PANSS-S scores. Low-dose olanzapine was well tolerated and significantly decreased the symptoms of schizophrenia in patients with treatment-resistant schizophrenia. A cab driver who was accosted by a pickpocketing gang of three Asian men in Melbourne's CBD has revealed how he was robbed of his wallet, credit cards and mobile phone. Michael Paul was waiting outside his workplace at Commonwealth Bank in Melbourne's CBD when the three men approached him about 10.30am on Tuesday. The one-time cab driver said
